

2. Requirement Analysis

Functional Requirements

The project requires a ServiceNow user to be created for testing, four custom roles to be configured, and a custom Institution Details table to be developed. The table must contain the required student, faculty, branch, email, phone number, and description information.

User and Role Requirements

A test user named EEE User is required for validating the access rules. The project uses four custom roles: bb1, bb2, bb3, and bb4. These roles are assigned according to the permissions required for reading, creating, updating, and deleting records.

Table Requirements

The custom table is called Institution Details and uses the system name u_institution_details. It requires Student Roll Number as an auto-number field, Student Name and Faculty Name as User references, Branch as a choice field with ECE, EEE, and CSE values, and Email, Phone Number, and Description fields.

Security Requirements

The READ ACL must check the Branch value and allow the intended EEE access. The ACL must also contain an advanced script that allows administrators and users with the required role. Separate CREATE, WRITE, and DELETE ACLs are required so that each operation can be controlled independently.

Validation Requirements

The completed configuration must be tested by impersonating users and checking the Institution Details list. The expected behavior is that access changes according to the user's roles, while administrators can access all records.
