

7. Project Demonstration

Purpose of the Demonstration

The demonstration is used to show that the ACL configuration works as planned. Each important part of the project is opened in ServiceNow and the access behavior is verified.

Step 1 – User and Roles

The EEE User is opened and the assigned roles are shown. The four roles, bb1, bb2, bb3, and bb4, are checked before testing the ACLs.

Step 2 – Institution Details Table

The Institution Details table is opened and the configured fields are displayed. Sample records with ECE, EEE, and CSE branch values are shown to demonstrate the data used for testing.

Step 3 – READ Access

The EEE User is impersonated and the u_institution_details list is opened. The READ ACL behavior is demonstrated using the EEE branch condition. The administrator account is then used to show that administrative access is not restricted by the branch condition.

Step 4 – CREATE Access

A user with the required CREATE permission is used to demonstrate the availability of the New button. The configuration is checked to confirm that the CREATE ACL is being applied.

Step 5 – WRITE Access

The WRITE permission is demonstrated using the required role combination. A permitted record is opened and the ability to modify the record is checked.

Step 6 – DELETE Access

The DELETE permission is demonstrated after the required role is available. The record operation is checked to confirm that the DELETE ACL is controlling the action.

Final Result

The demonstration shows the complete access-control flow and confirms that the different ACLs work separately while the READ operation uses the Branch field and advanced script to control access.
